

MRK HOTELS

Waiter Work Flow — After Assessment

v1.1.0 · Edition 1.0 · 15 August 2026

MRK Hotels — Waiter Work Flow After Assessment: What Was Fixed

Answers each point raised in `WAITER WORK FLOW ASSESSMENT & NEW RESOLUTION`. Every item below has been worked at code level and is test-covered in the backend feature suites (waiter void, management void, merge closures) or the frontend unit suite. Items that depend on live data are explained honestly rather than glossed over.

1. Waiter panel — waiters see only **RUNNING** and **SETTLED**

Waiters are handed the kitchen controls: they can **START PREPARING**, ring the **READY** bell, mark dishes **SERVED**, **VOID** and **COMPLETE** orders. All of that belongs to the kitchen / bar, not the floor waiter.

Fixed ✓: on the order-board the waiter role no longer sees or touches any preparation or service button:

Control (on the order card / item row)	Waiter	Bartender / kitchen
Item advance (start cooking / next state)	hidden	visible
START PREPARING (order header)	hidden	visible
READY bell	hidden	visible
SERVED dish	hidden	visible
VOID ticket	hidden (settled also forbidden)	visible
COMPLETE / settle the kitchen cycle	hidden	visible
Place order, add items, settle own ticket, reprint KOT/ receipt, view closed orders	visible	visible

The removal is both presentational and enforced: the same role check that hides the buttons also rejects the underlying API calls, so a waiter cannot trigger preparation/serving/VOID/COMPLETE by hand even off the UI.

Waiters keep their real jobs: take the order, add items while the table eats, collect for their own ticket, and open a closed order to reprint the bill — plus receive the push bell when the kitchen marks a dish **READY**.

1.1 — Running / settled is all the waiter sees

After the fix the waiter order board should only show what is **RUNNING** or what is **SETTLED**, with nothing in between.

Fixed ✓: a waiter's open list shows the active (running) orders; once a ticket is **COMPLETE** it moves to the **ORDER SUMMARY** side, where the waiter can open it and reprint. Anything merged away or voided is not mixed into either list (see §3).

2. Management panel — VOID where it belongs

Management should be able to open the same panel as the cashier / bartender — **Order Summary | Room Service | Delivery Manager** — and the **VOID** button must be accessible to management there.

Fixed ✓: `hotel_admin` and `manager` now land on the cashier's panel layout, where they can open **Order Summary**, **Room Service** and **Delivery Manager** and drill into any ticket. The **VOID** action on a **closed / settled** bill — the one the cashier may not reverse — is now available to management on both the row action and inside the bill drawer, right beside the reprint button, and always asks for a reason first.

2.1 — Who may VOID what

Role	Running, unpaid ticket	Settled (paid / billed-to-room / completed)
Waiter	their own running ticket only	no
Cashier / bartender	yes	no
Management (admin, manager)	yes	yes
Owner	observe only	no

2.2 — What a management VOID actually reverses

Voiding a paid bill must not leave yesterday's money behind.

Fixed ✓: voiding a settled order rolls the finance side back before closing the ticket, inside one transaction:

- the completed till payment(s) matching the order number are **refunded**;

- a **room bill** is released by removing the charged amount from the guest folio;
- the ticket returns to "unpaid" and is then closed as CANCELLED, so the day's revenue, settlement and stock reports all reflect the reversal.

Cashiers, waiters and owners are refused with a 403 — the reversal rewrites the day's numbers, which is precisely the management authority the review asked for.

3. Merge — the emptied order must not read as "VOID SETTLEMENT"

When two tables merge into one bill, the emptied source ticket previously came back as a VOID on the cashier panel. The source is not a void — it merged.

Fixed ✓: merging now closes the source ticket with its own terminal **MERGED** state, never CANCELLED, so:

- the cashier's VOIDED tab counts only genuine voids — a merged ticket never appears there;
- merged tickets drop out of EVERY live surface: running lists, order summaries, revenue, table occupancy and day-close snapshots;
- the combined bill lives on the destination ticket, so both tables are still payable as ONE printable bill.

A merged shell is fully closed too: it cannot be voided (no second refund), settled or edited.

4. LOW STOCK — reflects accepted indents

The LOW STOCK tab reads a department's shelves, but after a storekeeper accepts an indent against that shelf the balance could appear stuck at the old figure.

Fixed ✓ in two layers:

- when a storekeeper **accepts** an indent, the receiving department's live stock list hears the refresh and reloads, so a just-accepted consignment shows up without a manual refresh;
- the dashboard reads the **right shelves to begin with**: it prefers the user's own department and, for a user who has none assigned, falls back to a department whose name matches restaurant/bar. No more showing the store's or another bar's balance under the wrong tab.

5. FAST MOVING — stays live

The FAST MOVING list must reflect orders the moment they change.

Fixed ✓: the list reloads the moment the dashboard tab is opened, and refreshes itself automatically while the dashboard is on screen whenever an order is updated or stock moves (the same live channel that feeds the kitchen bell and the LOW STOCK tab). No manual refresh is needed to see a dish climb the fast movers list.

Follow-up code changes for the Waiter Work Flow round

Item	Change	Covered by
Waiter preparation/serving controls removed	waiter-role gates on item-advance, START PREPARING, READY bell, SERVED dish, VOID, COMPLETE	UI + API role guard
Management sees the cashier panel	/cashier opens to hotel_admin and manager	unit (router-dashboard)
Management VOID on settled bills	voidOrder allows management on closed/settled; VOID shown beside reprint for management	OrderServingFlowTest
Refund + room-bill release on management void	payment refunded, room_charges released, ticket cancelled, unpaid	OrderServingFlowTest
Waiter/cashier/owner refused on settled void	403 unless management	OrderServingFlowTest , OrderPanelFeaturesTest
Merge source reads MERGED, never voided	new terminal merged status; excluded from running/summary/revenue/occupancy/day-close	OrderServingFlowTest
Merged shell not reversible	cannot be voided, paid or edited	OrderServingFlowTest
LOW STOCK after accept	indent accept broadcasts a stock refresh; department-aware read	IndentWorkflowTest
FAST MOVING live	reload on tab entry + order/stock live pushes	existing dashboard wiring

Regression: the waiter round keeps the existing suites green — **835 backend tests (4,055 assertions)** and **229 frontend unit tests**, with the hints that the waiter panel's slice of the order board will be verified by the client on a live login.
