

MRK HOTELS

Review 03 — Housekeeping Task Export

v1.1.0 · Edition 1.0 · 15 August 2026

MRK Hotels — Review Batch 03 · Housekeeping Task Export (Problem & Solution)

Module: Housekeeping (Reporting) — **Status:** Resolved — **5 September 2026**

1. The Problem

Exporting the housekeeping task list to Excel/CSV produced a **spreadsheet that was hard to read and misaligned**: the right columns were missing or empty, and the column order came from somewhere arbitrary.

What this meant in practice:

- Managers could not rely on the export for daily housekeeping reports or handover sheets.
- Column headers and values did not line up, so the file needed manual rework before it was usable.
- Nothing told the export which columns to emit, so the generator guessed from the data it found.

2. Root Cause

- `HousekeepingPage.vue` called the shared `TableExportButton` **without passing** `:columns`, so the exporter's default behaviour took over.
- The shared exporter (`export.js`) reads values with flat `row[key]` access, but the housekeeping rows were **nested objects** (e.g. `{ room: { room_number, room_type, status }, assigned_to: { ... }, ... }`). A flat accessor therefore produced empty or mangled cells for anything nested.
- Column order and naming were derived implicitly from the object keys (`humanizeKey`) instead of being declared, so the result was whatever order the API returned.

3. The Solution

3.1 Flatten the rows at the source

- `loadAllTasks()` now maps each task into a **flat, export-ready row** with explicit fields:

Field	Meaning
<code>room</code>	Room number
<code>room_type</code>	Type of room

Field	Meaning
pax	Current guests
house_status	Housekeeping status (Clean/Dirty/...)
assigned_to	Assigned staff name
room_status	Occupancy status
arrival	Expected arrival
departure	Expected departure
nights	Number of nights
status	Task status

3.2 Declare the columns explicitly

- The export button now receives `:columns="exportColumns"` with the exact, ordered list of column titles shown above.
- `exportColumns` is defined alongside the loader so the header order, title casing and row keys are always in agreement.

3.3 Result

- The exporter writes real values for every declared column because the rows it receives are flat and the columns it renders are declared — no guessing, no nesting traps.

4. Files Changed

Area	File	Change
Frontend	src/pages/housekeeping/HousekeepingPage.vue	loadAllTasks flattens export rows; TableExportButton given <code>:columns="exportColumns"</code>

Shared helpers (`TableExportButton.vue` , `export.js`) already existed and were reused unchanged.

5. Verification Results

- Frontend `vite build` — **clean**.
- Frontend Vitest suite — **107/107 passed**.
- Backend — no API changes; full suite **569 passed / 2305 assertions** (unchanged).

6. Result

The housekeeping export now produces a clean, flat spreadsheet with ten well-named columns (room, type, pax, housekeeping status, assigned staff, occupancy, arrival, departure, nights, status), ready for reporting and handover without manual cleanup.
