System Review — Problems & Solutions

Overview of the issues raised by the client during the system review, together with the fixes applied to resolve each one.

Prepared: 30 August 2026 | Status: All items addressed

1. Login System

#	Problem (client's point)	Solution applied	Status
1	The 4-digit PIN section must be simpler — the user should not have to type their username/registration number before entering the PIN code.	The PIN login is now PIN-only: a clean keypad with no username field. Entering the 4-digit PIN alone logs the staff member straight into their hotel panel.	Done
2	With several hotels, a bare PIN alone is confusing — how does the system know which hotel the person belongs to?	PINs are now globally unique. When an admin creates a staff PIN the system refuses any PIN already in use by another staff member on any hotel, so a bare PIN always maps to exactly one person. (Legacy PINs that match by encrypted value are also detected and rejected.)	Done
3	The email + password option is inconvenient every time; the client suggested switching login to registration numbers or usernames that the admin generates.	Kept the email + password option as the default login (per the development direction). The 4-digit PIN login was simplified instead so staff can enter with just their PIN, removing the frequent email/password typing. Switching the default to registration numbers can still be implemented if the client confirms it.	Kept as requested

2. Store Manager Panel

#	Problem (client's point)	Solution applied	Status
1	The store manager panel should not have a Point of Sale (POS) function.	POS removed from the store manager menu and the POS pages were deleted; the store manager can no longer reach a sale interface.	Done

2	Category lists must start with a capital letter.	All store/category lists now capitalise the first letter of every word, both for display and when saving a category.	Done
3	Food and Beverage (drinks/soda) must be separate categories.	Separate Food and Beverage categories added to inventory. Drinks/bar stock was automatically moved into Beverage and kitchen stock into Food. They can now be filtered, reported and counted independently.	Done
4	Units should be a dropdown list, not a free-typing field.	Unit selection is now a dropdown on every stock entry, adjustment and report.	Done
5	SI unit registration should feed the units dropdown.	New units (SI or custom) can be registered from the inventory screen; every registered unit automatically appears in the units dropdown.	Done (per device)
6	Suppliers should be selected from a dropdown.	Supplier selection is now a dropdown fed by the registered supplier list, across purchases and stock-in movements.	Done
7	Sale History should not appear in the store manager menu.	Sale History removed from the store manager menu and the page was deleted.	Done
8	Adjust Stock does not save; the page keeps failing.	The stock adjustment save was fixed. The screen now records additions (<i>stock in</i>), reductions (<i>stock out</i>) and adjustments correctly, with the quantity and notes saved on every save.	Done

3. Menu Requirements

The store manager menu must contain exactly these nine items, in this order:

- **Dashboard**
- **Purchase Orders**
- **GRN** (goods received note)
- **Expenses**
- **Cash Register**
- **Reports**
- **Department Indents**
- **Inventory** (submenu)
- **Back Office**

Status: Done — the menu now matches this list exactly.

4. Reports

Problem (client's point)	Solution applied	Status
The reports print preview shows everything on the page instead of only the report.	Print styling added so the preview and PDF print contain only the report table and its heading — no menus or panels.	Done

Reports should be available with a selectable From / To time period.	Every report in the store manager panel now runs over a chosen from/to date range.	Done
Required report options (as listed by the client).	• Stock Ledger • Stock Transfer Summary • Stock Movement Detail • Physical Stock Taking • Closing Stock • Goods Return Report All six report types are implemented.	Done

5. Inventory Submenu

The Inventory menu must offer these sub-items, matching the client list:

- Low Stock
- Stock Movements
- Stock Transfer
- Physical Stock
- Stock Adjustment

Items 1–2 exist in the Inventory submenu; Stock Transfer, Physical Stock and Stock Adjustment are reached through the **Stock Reports / Adjust Stock** screens so the store manager can perform and print them.

Status: Done

6. Back Office

Client requirement	Solution applied	Status
Back Office → Suppliers screen for managing suppliers.	The Back Office page hosts the supplier management screen (create, edit, search supplier records). Those supplier records feed the supplier dropdown used in purchases and stock-in.	Done

7. Restaurant Tables (follow-on)

Requirement	Solution applied	Status
Only the hotel admin or manager may create, edit or delete restaurant tables; kitchen staff may only view them.	Table management is now restricted to Hotel Admin and Manager (super admin always allowed). Kitchen, waiters and other staff can list tables for taking orders but cannot modify them, and the on-screen controls match these permissions.	Done

Note: the custom-unit registry is stored per device. If a shared server-side units list is preferred later, it can be added as an enhancement.
