

PANEL YA MANAGER, ACCOUNTANT, NA DIRECTOR

Problems reported in the panel review and the solutions we have built (accessible dashboard, waiter order scoping, waiter settle removal, waiter table fix, table management and table grid scrolling).

1. The big change: a real DASHBOARD after login

Right after entering the password, the first page manager/accountant/director see is the Admin Overview page. We have **renamed it DASHBOARD** (“Dashibodi” in the Swahili interface) and it now presents the summaries at a glance. It also includes the front-desk, housekeeping and food & beverage summaries requested.

#	Problem (from the review)	Solution built
1	Post-login landing: the first page should be the (renamed) Admin Overview.	Manager, Accountant and Hotel Director now land on DASHBOARD (“Dashibodi”) right after login. The old reception stay-view dashboard is no longer shown to them; it is kept for the reception/housekeeping/serving staff who still need it.
2	DASHBOARD must show an F&B orders summary with total sales.	A F&B Orders card was added with All Orders, Orders Running, Orders Settled, and Total Sales = Bar sales + Restaurant sales . Bar and Restaurant are separated by the department of each order, and “settled” means the order has been completed and paid (cash, card or billed to room).
3	The employees section belongs in the back office, not on the dashboard.	The employees/staff management card was removed from the dashboard . Staff management now lives only in the back-office Staff page as requested.
4	Waiters were wrongly given the ability to settle (pay) their own bills.	Waiters and bartenders can no longer settle bills. Payment is now only done by the cashier (reception or above) from the Order Summary, exactly as the review asked.
5	Order Summary & Open Orders: a waiter must only see their own orders.	Floor staff (waiter/bartender) now see only their own tickets in Open Orders, the waiter F&B sidebar and the Order Summary. They can no longer see other waiters' orders.

#	Problem (from the review)	Solution built
6	Waiter table access: clicking an occupied table only showed a message.	Fixed. When a waiter (e.g. Bakari Ngoma) taps his own occupied table it now loads the items already ordered from that table and lets him add more items to the same order — no duplicate orders are created.
7	Manage Table: saving a table that already exists threw a server error.	Now returns a friendly “table already exists” message instead of a server error. The check is scoped to each hotel, so two different hotels may still reuse the same table number.
8	Scroll: with 150+ tables, does the tables cube scroll on its own?	The tables cube is scrollable inside its own area (set to a fixed height with an internal scrollbar), so with 150+ tables you can reach the last table without scrolling the whole page.

2. Build & test status

Verified — automatic checks

To confirm live

Frontend: all 103 unit tests pass and the production build succeeds. Backend: 34 targeted feature tests pass (table management, order flow, inventory, reports/overview). Code passes PHP lint and Laravel Pint style checks.

That the dashboard appears as the first page after login and that the waiter table / settle behaviour feels right when used live by the manager and waiters. These are look-and-feel checks we confirm together on the running system.

All eight points raised in the panel review are now addressed. If any detail should be adjusted after you check the live dashboard, we can tune it immediately.
