

RECEPTION PANEL — PROBLEMS & SOLUTIONS

Every issue raised in the reception-panel proposal, and how it was resolved. Prepared: 11 September 2026.

All changes are live after the latest deployments of the frontend and API.

1. Folio Operations

1.1 No way to move operations between folios (split / transfer / cut)

Problem: Staff could read a guest folio but had no way to move a selected charge or credit from one folio into another — so a group bill could not be split, an item could not be cut out, and a new folio could not be started mid-stay.

Solution: A two-panel operation modal was added. The left panel lists the current folio's transferable operations with checkboxes (plus a select-all), the right panel lists the folios to move into — searchable by folio code or guest, excluding the current folio — and an "Open new folio" button creates a fresh folio on the spot. A single Apply arrow performs the move; the folio and the "in-house" totals refresh automatically.

1.2 No visible reference number on a folio

Problem: Folios were identified only by guest name and totals, with no stable number staff could quote on the phone, in a note, or on a receipt.

Solution: Every reservation and folio now carries a folio code. A "FOLIO NO. / CODE" line is shown above the folio totals, generated automatically when the folio is opened and preserved through transfers.

1.3 Closed or settled folio lines could not be inspected read-only

Problem: Some folio entries are not editable (settled or archived), so there was no way to review their detail without risking a change.

Solution: Non-editable rows now offer a VIEW action that opens the entry read-only and briefly highlights the row, so detail is always available without exposing the entry to edits.

1.4 Tasks stayed open after the guest had checked out

Problem: After the departure date passed and the stay was checked out, cancelled or a no-show, staff could still add or delete folio operations — corrupting a closed stay.

Solution: Folio tasks are now gated by stay status: once the departure date has passed and the stay is checked out, cancelled or a no-show, both ADD and DELETE are disabled with an explanatory note. A closed folio can no longer be altered.

1.5 The operation modal was too narrow and broke on small screens

Problem: The folio modal was 640px wide, so the two operation lists felt cramped and collapsed badly on laptops and smaller screens.

Solution: The modal was widened to 960px and made responsive: it flows to full width minus padding under 1000px, stacks its panels on tablets (768px) and drops to a single column on phones (480px).

2. Corporate Clients

2.1 No place to record the companies behind guest stays

Problem: Corporate clients live nowhere in the system; reception had no way to keep the list of companies that guarantee or endorse stays, with their TIN and contacts.

Solution: The Company Data page now pairs the hotel-profile card with a corporate-client directory: every company on the wheel can be listed, added, edited and deleted, capturing name, TIN number, address, city, phone,

email, contact person, notes and an active flag. Receptionists get read access; adding and editing is limited to managers.

3. Manager Payments Access

3.1 The Payments tools were hidden behind a single link

Problem: Managers could reach Payments, but the payment-related tools — payments list, cashiering, cash drawer, business source, company data, POS and exchange rate — were compressed into one Front Desk link, so most of them were effectively out of reach.

Solution: The manager sidebar now nests a Payments sub-accordion under Front Desk that exposes every payment-related page, and it auto-expands when the manager opens the Payments screen, so the tools are immediately visible instead of buried.

4. List Actions

4.1 Edit and delete buttons could be tapped together

Problem: The edit and delete buttons on list rows sat flush against each other, so a quick tap could hit the wrong action.

Solution: The action buttons are now wrapped with an 8px gap on every affected list, so a stray tap no longer lands on the neighbour action.
